Projects:

- **Android:**

-As a final project for my Software Bachelor, I've developed an Android App all alone.

-The basics of this App was for managing ROL-playing game character sheets. Each user could have their own account where you can store all your data on a Cloud Server (I used AmazonWS), done with MySQL with XAMPP. And for getting all the data I've developed my own Webservice with PHP.

<https://github.com/Delestor/AlcaROL>

-WebService project repository:

<https://github.com/Delestor/alcaRolWebService>

- **ERP(Dolibarr):**

-Second project for my Software Bachelor, worked with 8 other people

-We've built a system to manage a Nursing Home here in Catalonia (Casal d'Avis de l'Ajuntament d'Alella), where we decided to use Dolibarr ERP. We adjusted some of their modules so they can suit up to our necessities. All the coding work was done in PHP
